Office Action Summary

Application No.

10/057,089

Applicant(s)

LIEDL ET AL.

Examiner

Helen F. Pratt

Art Unit

1761

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 14 October 2004.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-12 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-12 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- ☐ Notice of References Cited (PTO-892)
- ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____
- ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
- ☐ Notice of Informal Patent Application (PTO-152)
- ☐ Other: _____

DETAILED ACTION

The final rejection of the last office action has been withdrawn, in favor of the rejections found below.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-12 are rejected under 35 U.S.C. 102(b) as being anticipated by Wong '357.

Wong '357 discloses a nut butter containing nut ingredients, seasonings, stabilizer, emulsifier and bulking agents at within the claimed amounts, with a particle size distribution of which 90% of the particles are less than 40 microns, and 50% of the particles are smaller than about 10 microns (abstract and col. 20, lines 18-25) as in claims 1 and 7. 1.4% of the particles are larger than 58.7 ("30 to about 42% of the water insoluble solids have a particle size of about 10.1 microns or greater (abstract)). The particular spreadability of 4.000 kg to 5.300 as in claims 1, 6, 7 and 12 is seen to have been inherent in the composition because the claimed particle sizes have been shown as would have been the viscosity of claims 2 and 8.

Claims 3 and 9 further requires nuts, a nut slurry or defatted nuts and claims 4 and 10, nut oil and claims 5 and 11, the use of peanut ingredients. Ground peanuts can be used as in claims 3 and 5, and 9 (col. 3, lines 50-61 (Wong '357)).

Nut oil is found inherently in nuts as in claims 4 and 10.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1, 3, 4, 5, 9-11, 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wong et al. '357 in view of Wong et al. '645.

Wong '357 discloses a nut butter containing nut ingredients, seasonings, stabilizer, emulsifier and bulking agents with a particle size distribution of which 90% of the particles are less than 40 microns, and 50% of the particles are smaller than about 10 microns (abstract and col. 20, lines 18-25). Claims 1 and 12 differ from the reference in the limitation that 1.4% of the particles are larger than 58.7 microns and in the particular spreadability of about 4.000 kg to about 5.3000 kg. Wong et al. '645 disclose that it is known that chunky type peanut butter is made with larger peanut granules (col. 1, lines 54-55) and that nut spreadability is determined by the particle size of the nuts (col. 1, lines 65-70 and col. 2, lines 1-10). Therefore, it would have been obvious to vary the nut particle size in order to achieve a particular spreadability as shown by Wong '645 in the process of Wong '357 and to add large size peanut granules to make chunky type peanut butter as shown by Wong '645 in the process of Wong '357.

Claims 3, 9 and 11 further requires nuts, a nut slurry or defatted nuts and claim 4, nut oil and claim 5, the use of peanut ingredients. Ground peanuts can be used as in claims 3 and 5 (col. 3, lines 50-61 (Wong '357)). Therefore, it would have been obvious to make a nut butter using the claimed ingredients as shown by the combined references.

Claims 4 and 10 further require nut oil in the composition. Wong '357 discloses the use of oil as in triglycerides (col. 6, lines 56-70). Also, nuts inherently contain a lot of oil. Therefore, it would have been obvious to substitute nut oil in place of triglycerides as they are both oils and it would have been obvious to use nut oil since nuts inherently contain oil.

Claims 2, 6, 7 and 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wong '357 in view of Wong '645 as applied to claims 1, 3-5, 9-12 above, and further in view of Meade.

Claims 2 and 8 require particular viscosities. Meade discloses a viscosity of 6,000 to 50 centipoise, which is the claimed lower range (col. 10, lines 26-30). Therefore, it would have been obvious to use a viscosity as disclose by Meade in the composition of Wong '357.

Claim 6 requires a particular spreadability. The particular spreadability has been shown because the particle sizes of nuts have been disclosed as above. Also, it would have been within the skill of the ordinary worker to vary the particle size to achieve a particular nut size as it is known that the particle size affects the viscosity of the product, i. e. the spreadability. Column 5, lines 5-19 of Wong et al. '357 disclose various poise

below 7,000 poise. No criticality is seen in the particular level of spreadability at this time absent a showing that 4 kg as claimed has a different spreadability than below 7000 cp or the 6,000 cp of Meade. Therefore, it would have been obvious to use known viscosities which would have resulted in particular degrees of spreadability.

Claim 7 further requires that the composition is a reduced fat nut spread and that 10% of the particles are smaller than about 3 microns. Wong et al. '357 disclose a reduced fat spread (col. 18, lines 60-70, and col. 19, lines 1-9). Wong et al. '357 discloses that 30% of the particle sizes are less than 6.2 which encompasses 3 microns (abstract). Nothing unobvious is seen in using 10% of very small particles instead of 30% absent a showing of unexpected results. Also, Wong et al. '357 discloses that 91.5% of the particle sizes are 3.8 microns or greater, which means that 8.50% are smaller than 3.8 microns. No patentable distinction is seen in these amounts absent a showing of unexpected results. Therefore, it would have been obvious to make a reduced fat spread as shown by the combined references. The further limitations of claim 12 have been discussed above and are obvious for those reasons.

Response to Arguments

Applicants arguments filed 10-14-04 have been fully considered but they are not persuasive. Applicants argue that the present invention uses a gap mill process to produce a superior nut butter which is very spreadable and that takes less force to spread with a knife. However, nothing is seen in the claims as to the use of a gap mill process, and in a composition claim the process of making the composition is not given weight. The fact that the procedures of the reference are different than that of applicant

Art Unit: 1761

is not a sufficient reason for allowing the product-by-process claims since the patentability of such claims is based upon the product formed and not the method by which it was produced. See *In re Thorpe* 227 USPQ 964. The burden is upon applicant to submit objective evidence to support their position as to the product-by-process claims. See *Ex parte Jungfer* 18 USPQ 2D 1796. Even though the claims are not product by process claims, the above argument is argued as if they were.

Applicants argue that that the dependent claims require specific viscosities, nut ingredients, the addition of oil, and a spreadability of about 4.915 kg to about 5.215 kg. These limitations have been all disclosed or discussed in the office action. Nothing has been presented to show that the particular claimed particle sizes do not make a spreadability within the claimed range. The Patent Office does not have any way to determine such data. Applicants' specification discloses that the "spreadability characteristics result, in part from some or all of the physical characteristics, such as particle size distribution, relative amounts of fine and coarse sizes particles to medium size particles and oil release which are a function of the gap mill process of the present invention" (page 14, para. 0051). The particle sizes have been disclosed above, and nothing is seen that oil would not have been released when such particle sizes were made since these particle sizes are known.

Applicants argue as to claim 7 that the reference to '357 discloses a nut paste having a monomodal particle size distribution with 50-100% water insoluble solids having a particle size of less than 21.6. However, Applicants also have 50% of the

Art Unit: 1761

particles being less than 21.6, i. e. 10 microns. A monomodal distribution has not been excluded by the claims.

Applicants argue that the examples show a comparison between the spreadability of conventional brands as opposed to their product. However, a showing is need as to the spreadability of the combined references and the applicants' product.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Helen F. Pratt whose telephone number is 571-272-1404. The examiner can normally be reached on Monday to Friday from 9:30 to 6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mr. Milton Cano, can be reached on 571-272-1398. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
